

BADGE

```
<div class="container">  
  <span class="badge bg-primary">badge</span>  
</div>
```

While writing badge → bg color is mandatory → otherwise we won't get output

In between anything and anywhere we can use badges

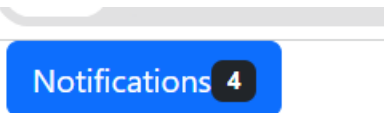

```
<div class="container">  
  <h1>VARSHITH <span class="badge bg-primary">badge</span></h1>  
  <p>lpu <span class="badge bg-primary">badge</span></p>  
</div>
```

The size of the badge will depend upon the tag which we will use or in which tag we keep badge

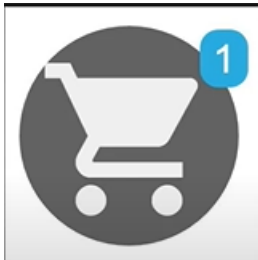

We will see by using button tag →

```
<div class="container">  
  <button class="btn btn-primary">  
    Notifications<span class="badge bg-dark">4</span>  
  </button>  
</div>
```

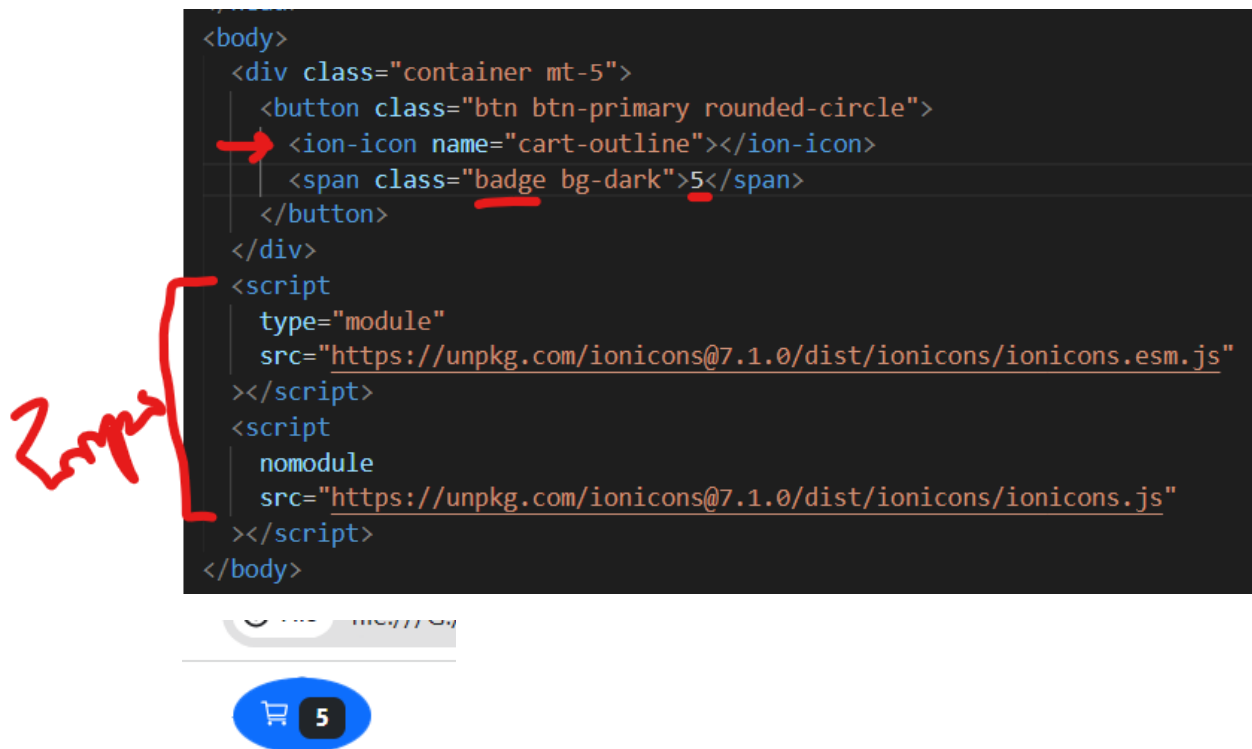

Task -→

Now we will implement this →

For this type of icons -→ go to -→ [ionicons website](#) →
import cdn link and use it

It should at power place -> so we have add positions
